functions
inbuilt function
mdn docs

object methods

object ----> key and value pair
keys will always be unique.

```
let object= {
"name": "flm"
}
```

dot method and bracket method
object.name / object ["name"]

add
object.age=23 / object["age"]= 23

update
object.name= "surya" / object["name"]= "surya"

delete
delete object.name / delete object["name"]

functions
object datatypes---> number, string, boolean, null, [], object,
function.

a object which consist of a function in it is called object method.

instead of writing the logic outside somewhere, the developer want to put the logic related to form in oneplace so that it is much readable

key<---> value ------> function declaration and calling

{
Name: "" F(n "

DOB: 20/20/2024

address: Hyderabad

Marks:
{
Phy: 35

chem: 35

Math: 90
}
}

Reset all the details

the developer started storing function declaring inside the object.

they are calling the function outside.

this function which is stored inside the object is called object method.
